## Abstract:

Today as we look around, we see that technology has taken over the world. However this is not how Mother Earth always looked like.

There existed a time before internet, smart-phones and intelligent robots, a time, millions of years ago, when humans lived in caves and survived by hunting for food. This began with the evolutionary history of primates which continued for centuries, finally leading to the emergence of anatomically modern humans, although studies have shown that the modern human species, *Homo Sapiens*, has a very close relationship to another group of primate species, the apes. It is said that human evolution started as long as six million years ago.

It is this very evolution of man that we intend on showing through our project, as to how from being cavemen, we went on to become urbane.
